FOR IMMEDIATE RELEASE

Women's Health Specialist Publishes Book Exposing Medical Industry's Coverup of Effective Treatments for HPV and Cervical Dysplasia

March 18, 2016 – Conventional medicine claims there is no [treatment for HPV](#) and that surgery is the only [treatment for cervical dysplasia](#). In *Painting a Target on HPV*, Dr. Nick LeRoy reveals decades of evidence to the contrary, effectively challenging the OBGYN standard of care.

Chicago, IL – Over 80%ⁱ of women get the Human Papilloma Virus (HPV) – a potentially cancer-causing viral strain – during their lifetime, in the United States alone. When HPV is left untreated, as many as one million women each yearⁱⁱ develop [cervical dysplasia](#), the proliferation of abnormal cells in the cervix. In turn, when [cervical dysplasia](#) is left untreated, over 12,000 women each year develop [cervical cancer](#), with one third of these women dying from it.ⁱⁱⁱ The conventional medical response is to administer the [Gardasil® and Cervarix® vaccines](#) to [prevent HPV](#); to take a “wait-and-see” approach if a woman contracts HPV; and to recommend invasive surgery of the cervix, if a woman contracts moderate to [severe cervical dysplasia](#) or if the HPV already has caused [cervical cancer](#).

Dr. Nick LeRoy, a cutting-edge [women's health specialist](#), maintains that this approach is not only foolhardy but also unethical and even criminal, for three reasons:

1. The Vaccines Turn Girls into Guinea Pigs

The OBGYN standard of care advises administering the vaccines to girls as young as 11 years old, in the interest of [preventing cervical cancer](#). The vaccines cover only a fraction of the strains of HPV that can lead to [cervical cancer](#), however, and the vaccine studies – which were fast-tracked by the Food and Drug Administration (FDA) – were conducted over the course of about three years, whereas cancer can take more than 20 years to develop.^{iv} For these reasons, *there are no studies* that demonstrate the efficacy of the vaccines in [preventing cervical cancer](#). Meanwhile, in the past decade, the federal Vaccine Adverse Events Reporting System (VAERS) received shy of 40,000 reports of adverse reactions to the [Gardasil® and Cervarix® vaccines](#) – including seizure, facial paralysis, stroke, and death.^v

2. Waiting Is Dangerous

The wait-and-see approach causes anxiety and potentially endangers women's lives, for no reason, considering that there are effective and [natural treatments for HPV](#) and [mild cervical dysplasia](#).

3. Surgery Exacerbates Problems

For moderate and severe, pre-cancerous lesions, these natural remedies offer a more effective, less expensive alternative to surgery. [Loop Electrosurgical Excision Procedure \(LEEP\)](#) or [conization surgery](#) can damage a woman's cervix, and in as many as one-third of the cases, it fails to [eliminate HPV](#) and may require repeat surgical procedures. According to a systematic review and meta analysis in the *British Medical Journal*, these surgeries also have been associated with “significantly increased” risk of miscarriages.

Additional studies have indicated that these surgeries have caused infection, scarring, and a narrowing or loss of the cervical canal – in turn causing infertility.

Even in the best case scenario, recovery from these surgeries necessitates four to six weeks of bedrest, interfering with a woman's ability to function, and research in peer-reviewed journals such as *BJOG: An International Journal of Obstetrics & Gynaecology* suggests that women's sexual desire and pleasure may be compromised following surgery. Indeed, [cervical dysplasia](#) chat rooms are flooded with reports of decreased ability to orgasm, decreased clitoral sensitivity, and increased discomfort during sex, following these surgeries.

Perhaps worst of all, immunologic research has established that HPV infects the immature cervical cells residing in the deepest layer of the cervix, but not the mature cells at the surface. It therefore stands to reason that surgery may actually *increase* [HPV infection](#), by creating a point of entry for the virus and exposing these vulnerable areas to contamination.

Following a comprehensive evaluation of the current standard of care for [treating HPV](#) and [cervical dysplasia](#), *Painting the Target on HPV* offers a detailed, scientific exploration of the natural alternatives for [cervical dysplasia treatment](#), both topical and oral, which have proven effective in clinical settings nationwide, as well as in a case study published in a peer-reviewed journal: **Topical treatment** applies to the cervix an [escharotic solution](#) made of bloodroot and zinc chloride. Several mechanisms of this solution cause it to seek out and destroy infected tissues, while leaving healthy tissues untouched. **Oral treatment** relies on an evidence-based combination of 1) an immunity-boosting diet, which amplifies the body's ability to seek out and destroy HPV cells, and 2) a cocktail of supplements that inhibit the malignant transformation of [HPV-infected](#) cells.

Over the past 20 years, Dr. LeRoy has utilized both treatments simultaneously and, as a result, has eliminated mild to severe [cervical dysplasia and HPV](#), in hundreds of women, with a 99% success rate for [eliminating cervical dysplasia](#) and a 91% success rate for [eliminating HPV](#). Dr. LeRoy has documented hundreds of cases, some of which are featured in *Painting a Target on HPV* and the rest of which Dr. LeRoy is currently preparing for submission to peer-reviewed journals, as the first case series of its kind.

Book Endorsements:

Anyone looking to prevent cervical cancer should read this book. Dr. LeRoy's natural methods for [treating cervical dysplasia](#) using supplements and dietary changes are things every patient should know about. – Kelly Turner, PhD, *New York Times* bestselling author of *Radical Remission: Surviving Cancer Against All Odds*.

About Dr. Nick LeRoy

The author of *Painting the Target on HPV*, Dr. Nick LeRoy is a cutting-edge [women's health specialist in Chicago](#), IL. He has been featured in top media including ABC, NBC, and Fox; he has served as faculty at leading integrative medicine institutes in the Midwest, including the National University of Health Sciences, the Midwest Center for Oriental Medicine, and the Wellness and Massage Training Institute; he has presented at diverse venues including Gilda's Club, Rush Presbyterian Hospital, and Cook County Court House. Dr. LeRoy's [integrative medicine training](#) included gynecology, internal medicine, acupuncture, chiropractic, and nutrition, and over the past 20 years, Dr. LeRoy has brought this wealth of knowledge to his work in natural [cervical cancer prevention and natural breast cancer prevention](#). He has treated hundreds of cases of [HPV and cervical dysplasia](#), with a 99% success rate for [curing cervical dysplasia](#) and a 91% success rate for [curing HPV](#).
